Approach

As mentioned the happy flow is already tested, so freestyle is the guideline of my exploratory testing approach mainly try with discovering functions this feature offered
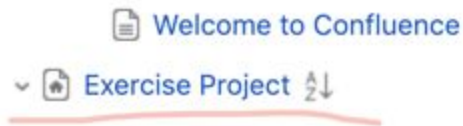

Scenarios

All below scenarios included verifying the pages involved can be opened and user is able to revert the change back to original, also check on the left the page hierarchy and order has been updated after actions

1. Drag and drop an unrestricted page under a restricted page
2. Drag and drop a restricted page under an unrestricted page
3. Drag and drop a restricted page under a restricted page
4. Drag and drop different type of page, making them parent and child of each other
5. Drag and drop a page which already contains child pages, to be a new child of another page
6. After step 5, drag this page to another parent page
7. Drag a page out of the space
8. After step 7, drag the whole space under that page to make the space as a child
9. Drag a parent page to be a child page itself
10. Drag a parent page to be a grandchild page itself
11. Drag a page to other places, e.g to the left side navigation bar
12. When parent page is collapsed, try to use sorting function

Defects

1. Not very sure about the requirement but it's a bit weird that a page can be out of any Space or have the same level as a Space, this resulting in other people cannot find the page anymore, I will raise a question for this behaviour see if it's acceptable or not
2. Intermittently, after taking out all child pages from a parent, it's still showing sorting function and expand function available for the parent page, clicked the sorting icon but

didn't   do   anything,   have   to   refresh   to   update

3. Intermittently, after dragging in child pages, sorting function is not showing up

Test Recommendations

1. Do more testing by using different accounts to see how restriction feature works after changed the hierarchy, e.g can another user still access an unrestricted page after it became to a child of a restricted page?
2. Page like File List contains a child upon creation, see how it works after change the parent-child relationship
3. All offered types of pages should be tested with this "Reorder Page" feature
4. Need to test when multiple people working on the same Space, dragging and sorting pages, does it making conflicts? Might involve load testing or stress testing in this scenario.
5. Need to test functions inside the page, e.g link and slack notification still working as expected after using this "Reorder Page" feature
6. Need to check if the sent shared link still working after using "Reorder Page" feature
7. Need to do performance test when dragging 20 pages with attachments
